

SENIOR PRODUCT MANAGER • PREDICTIONS EXCHANGE

I would join with hypotheses — and execute like an owner.

A first-90-days plan for turning the Predictions Exchange into a stronger engine for B2C engagement, B2B reliability, and global market expansion.

Exchange technology

Prediction markets

Sports + event trading

B2B + B2C platform

01

THE BET

Predictions is not just a feature. It is an exchange, a trust layer, and a habit loop.

The product wins when users trust market creation, liquidity, execution, settlement, and the repeatable rhythm around sports and global events.

MY STARTING HYPOTHESIS

The highest-leverage work is reducing friction between market opportunity, liquidity confidence, and repeat trading behavior.

02

My track record is already measured in the metrics this role cares about.

FINTECH INFRASTRUCTURE

\$1.5M

ARR multi-custodian platform

Shipped access controls, identity flows, and custodian integrations used by thousands of advisors across major North American banks.

CRYPTO EXECUTION

+60%

44-day live trading result

Operate strategies across derivatives, futures, on-chain perpetuals, EVM arbitrage, wallets, DEX liquidity, and async failure modes.

OPERATING LEVERAGE

38%

Delivery velocity lift

Rebuilt a 20+ person product operating model, improved NPS by 35 points, and raised team output by ~30% with AI workflows.

The Predictions Exchange has four customers.

A strong roadmap should balance user growth with platform quality. Each customer has a different definition of success.

1 B2C traders

Find markets fast, understand odds, enter/exit smoothly, trust settlement.

2 B2B partners

Need reliable APIs, scalable market operations, uptime, and predictable product behavior.

3 Internal operators

Need market launch workflows, risk controls, tooling, support visibility, and incident clarity.

4 Leadership

Needs growth, regulatory alignment, strategic expansion, and a platform that compounds.

Trust / reliability

The first question I would answer: what metric is blocking scale?

ACTIVATION

A1

First market viewed → first trade placed → first settlement understood.

RETENTION

R7

Repeat trading within 7 days after first resolved market or first sports event.

LIQUIDITY

LQ

Spread, depth, time-to-fill, and failure rates during peak event windows.

PLATFORM

SLA

Market uptime, settlement latency, API reliability, support tickets, incidents.

I would avoid vanity metrics early. The focus should be the bottleneck that prevents reliable, repeated, confident trading.

PHASE 1 — LEARN THE SYSTEM, IDENTIFY CONSTRAINTS

First 30 days: map the exchange, the users, and the execution reality.

PRODUCT + BUSINESS

Understand the operating model

- Clarify B2C vs B2B priorities
- Map market lifecycle from idea to settlement
- Review top growth, churn, and support signals

ENGINEERING + DATA

Find the technical bottlenecks

- Review architecture, APIs, dependencies
- Understand backlog, incident history, release cadence
- Audit observability and product analytics gaps

STAKEHOLDERS

Build trust fast

- Meet VP Product, Eng, Design, Ops, Legal, Marketing
- Align on “what must not break”
- Create a shared working rhythm

06

PHASE 2 — CONVERT AMBIGUITY INTO EXECUTION

Days 31–60: tighten the roadmap around the highest-leverage product constraint.

BACKLOG

Prioritize like an exchange PM

Rank work by impact on liquidity, reliability, revenue, regulatory safety, and engineering effort. Create clear trade-offs, not a feature wishlist.

MARKET LIFECYCLE

Improve the operating loop

Reduce friction in market creation, pricing, risk review, launch readiness, visibility, settlement, and post-event support.

GROWTH LOOP

Design retention experiments

Test watchlists, event reminders, market education, post-settlement reactivation, and sharper sports/event discovery.

Output by day 60: a sequenced roadmap with 2–3 measurable bets, aligned with engineering capacity and leadership priorities.

07

PHASE 3 — SHIP, MEASURE, INSTITUTIONALIZE

Days 61–90: ship one meaningful bet and install the operating cadence.

SHIP

One measurable release

- Improve a key conversion or reliability point
- Launch with clear success criteria
- Measure before/after impact

SCALE

Make the roadmap durable

- Define metric owners
- Formalize intake and prioritization
- Lock weekly product/eng/ops cadence

EXPAND

Set the next horizon

- Identify scalable B2B platform opportunities
- Surface market expansion patterns
- Propose 6-month roadmap options

08

STRATEGIC EXPANSION BET

Predictions can become the embedded market layer for trusted fan ecosystems.

Hypothesis: Crypto.com can sell a regulated, white-label or embedded predictions platform to organizations like FIFA, NHL, NBA, Formula 1, UFC, and major global brands — turning existing fan attention into new revenue for partners and Crypto.com.

Fan engagement

Embedded liquidity

Trusted institutions

First CDNA exchange

Trusted / regulated rails

WHY THIS COULD WORK

- Fans already trust leagues, teams, and major brands more than new prediction-market venues.
- Those partners own demand, distribution, moments, data, and large recurring event calendars.
- Many fans understand sports opinions, but are not yet educated on prediction markets.
- Crypto.com can bring regulated exchange infrastructure, market operations, custody, payments, and settlement — positioned as the first CDNA exchange in the user's framing: trusted, regulated, and already distribution-ready.

09

Example bets I would validate — not blindly ship.

B2B

B2B platform hypothesis

Validate embedded or white-label predictions with trusted sports, entertainment, and brand partners as a higher-revenue expansion path.

LIQUIDITY

Peak-window readiness

Monitor depth, spreads, latency, failed orders, and support volume around major events to identify the trading bottleneck.

DISCOVERY

Event-to-market funnel

Make it easier to find the right market at the right moment: sports schedules, trending events, watchlists, and "next best market."

RETENTION

Post-resolution loop

After a market settles, guide users into relevant next events instead of letting the session end cold.

TRUST

Settlement confidence

Improve user confidence around market rules, resolution timing, dispute handling, and what happens after an event ends.
